Why USD Affects Gold

01

Global Pricing in USD

Gold is priced globally in US Dollars. When the dollar strengthens, you need fewer dollars to buy the same amount of gold — making gold appear cheaper and dampening demand.

02

Inflation Hedge

As the USD loses purchasing power through inflation, investors turn to gold as a store of value. This relationship has held for centuries — gold preserves wealth across currency crises.

Stat		Correct Value
📈 Gold Return 2020–2026	-	+218.6%
🏆 Longest Market Phase	-	Surge - 650 days
⚡ High Volatility Days	-	540 days
📉 Strongest Inverse Day	-	Mar 18, 2026

03

Interest Rates

When the Fed raises rates, USD-denominated assets like bonds yield more, reducing the appeal of non-yielding gold. Lower rates have the opposite effect — pushing investors toward gold.

04

Safe-Haven Demand

During geopolitical crises or economic uncertainty, investors flee to both gold and the USD simultaneously — temporarily breaking the inverse correlation and causing both to rise.
